What is the sense in training the project's internal community on the themes shown in the MR, since they are employees of a farm that is essentially a soybean producer?

It is mentioned as an action implemented in HCV an "articulation" with the local environment office and awareness raising activities. Articulation of what, exactly? What "awareness raising" activities were carried out in this HCV? For which audience? How does this relate directly to the project?

It is observed, during the MR, few social actions directed to the problems that effectively lead to deforestation. On the other hand, there are more diagnostic actions. These actions are normally developed during the project design period in order to help understand the local problems and then elaborate the project. Clarify the causal link between deforestation and social factors that the project intends to address.

It is not clear whether the project has action aimed at deforestation agents.

It was not possible to understand a clear action plan for biodiversity monitoring, other than protect the PA forests.

How does the project ensure that just maintaining the Project Area forest is keeping the population of certain species conserved, without constant monitoring at a species level?

How does the project intend to handle data collected every 6 years to direct its practical biodiversity conservation efforts?

Which species will be monitored? What is the current population status of the species for baseline and future comparison purposes to know whether or not the project contributes to biodiversity conservation?

It is well known that fragmentation directly affects the survivability of certain species. Thus, conserving small fragments (PA) while the project zone is intensely deforested cannot be used as an argument to ensure that "such species" have their status maintained as converted. According to the CCB + any biodiversity conservation standards, it is necessary for the project to promote actions directed at biodiversity conservation by observing, measuring and monitoring clear population indicators and/or acting directly on drivers that put pressure on local biodiversity such as hunting, road kill, etc. In this sense, what is the Biodiversity strategy of this project to apply for the CCB standard?

What is the real point of establishing city schools as LMA?

Considering that teachers are not the agents of deforestation, how does the action taken at LMA (teacher training) relate to the maintenance, or not, of the carbon stock of the leakage belt?

It is not clear whether the deforestation agents were involved in the actions carried out in the LMA or at least invited to participate. Thus, how to explain the 5% value considered as DLF?
