Comment:

The PANTANAL REDD+ PROGRAM project is a REDD+ APD grouped project developed based on the VM0007 Methodology for Avoided Planned Deforestation and CCB - Climate, Community and Biodiversity Standards (Version 3.0, VCS Version 4.3).

The main additionality of the project is based on the conservation of the forest under the allegation of the existence of a surplus Legal Reserve that could be deforested in accordance with the Brazilian Forest Code, however the license for this was not evident in the shared materials. If there is evidence, the project is additional.

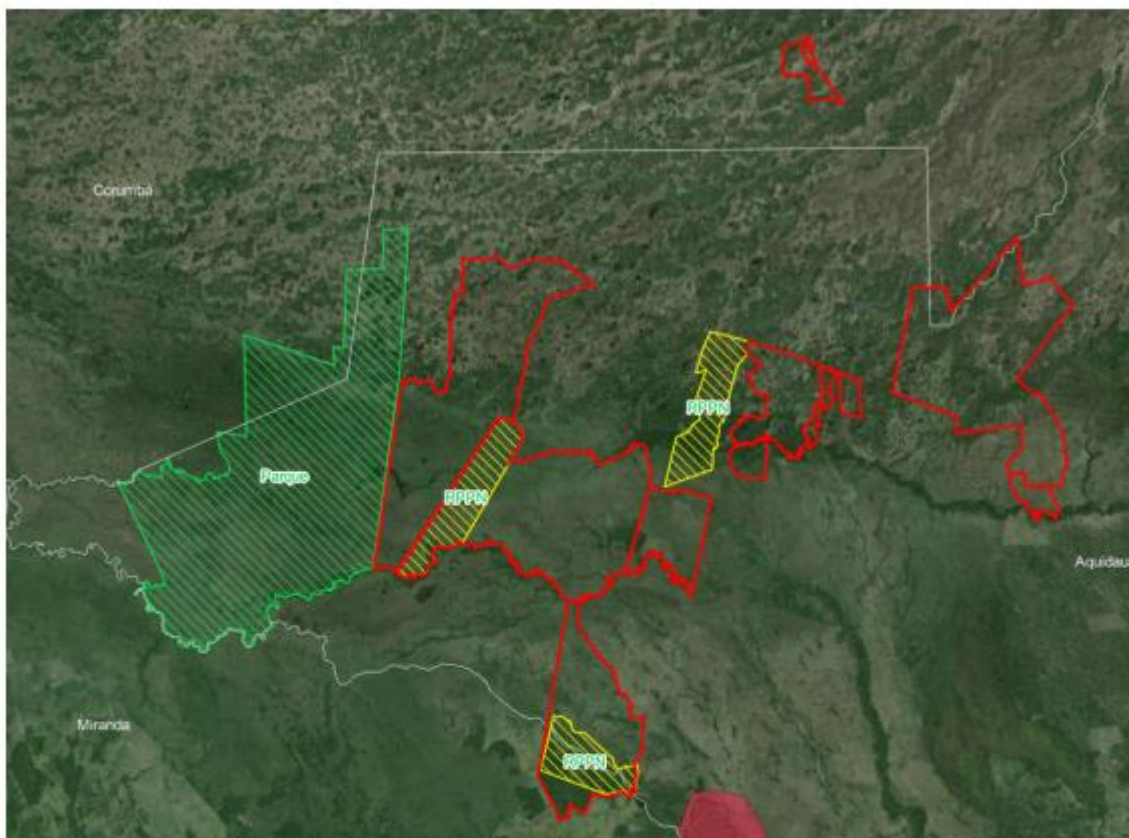

The project baseline is consistent with the history shown by the developer in the project region, the Pantanal. The most likely scenario considered is legal deforestation for the expansion of livestock farming by the owner. However, what is most commonly observed is the advancement of illegal deforestation or deforestation of the Legal Reserve surplus without an environmental license.

The expected emission for the 11,800 hectares over a 20-year emission period is 4,856,884 net VCUs (discounting leakage and buffer) with an annual average of 242,844 VCUs, a net stock of 411.6 tCO₂eq/ha, which can be considered overestimated when compared to what is found in the Pantanal phyto physiognomies by IBGE. The Project does not make clear how the credits will be divided with the community, land owners, and developer. According to the developer, it is under construction and will be presented confidentially to VVB.

The stakeholder identification process identified 6 groups: landowners, property employees, NGOs, public bodies, research and extension institutions and associations. There were 03 consultation processes with stakeholders, involving local visits and online meetings, which are part of the construction of the FPIC.

The land is owned by third parties, however, according to the project developer, all areas have proof of ownership by third parties, in addition to partnership contracts in force with the developer. It is not possible to evaluate the documents, as they are all confidential and only available to VVB.

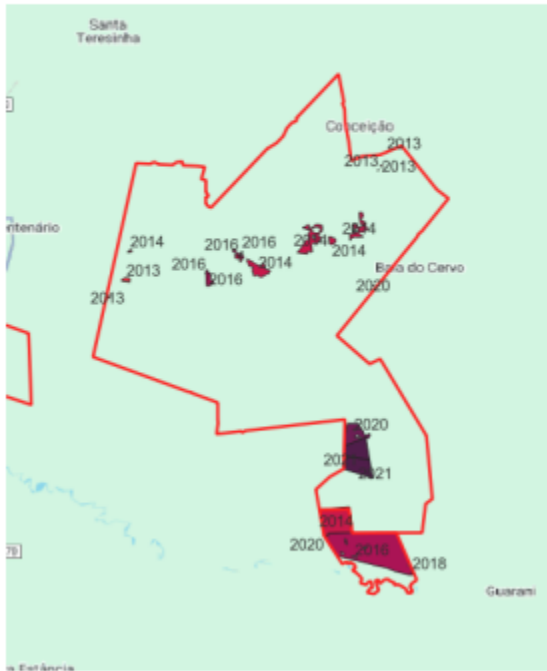

In a spatial analysis of the project's Property complex, it does not show any intersection with Integral Conservation Units, Indigenous Lands, Quilombolas. The intersection of two RPPNs was verified: RPPN Fazenda Santa Sofia (8,056.50 ha) and RPPN Estância Caiman (5,511.68 ha).

LOGGING

According to the PRODES base, in the last 10 years there has been deforestation within the project limit in the following areas, totaling 1868 ha.

CAR ASSESSMENT

All 14 properties registered in the CAR that intersect the project limits are exclusive, that is, they do not have intersections between them.

Below is a table showing the status of CAR properties:

cod_imovel	status_imovel	condicao	uf	municipio	m_fiscal
MS-5001102-9D08F3CE7C2141A289C1EF26A02CB2EE	ATIVO	Aguardando análise	MS	Aquidauana	27.48

Comment:

Decree No. 14.273, of October 8, 2015: Provides for the Restricted Use Area of the Pantanal floodplain, in the state of Mato Grosso do Sul has been suspended by Decree n.º 16.248, of August 2023, which states that until the competent state law is enacted, which will regulate the provisions of Article 10 of Federal Law No. 12,651, of May 25, 2012, the granting of licenses or authorizations related to the suppression of native vegetation in the Restricted Use Area of the Pantanal Plain and the Pantanal Biome is suspended, as well as the suspension of ongoing processes and the initiation of new ones. A clear situation of legal uncertainty with regard to the rules that could guide APD projects in the future.
