Quality of the Monitoring Plan and Technological Innovation

The monitoring plan presented in section 5.3 demonstrates a commendable technical commitment to precision and transparency, particularly through the integration of tools such as NDVI, EVI, Δ NBR, and LiDAR for biomass and land-use monitoring. To further enhance this approach, it would be valuable to consider the complementary use of statistical metrics such as the Kappa index and geographically stratified accuracy assessments, which could strengthen data reliability in ecotonal and transition areas.

Commitment to Safeguards and Traditional Peoples

It is very positive to observe the project's concern for traditional and Indigenous communities in its area of influence. Given the sensitivity of the region, we recommend further documentation of the free, prior, and informed consultation process, including evidence such as signed minutes, audiovisual records, and official opinions from representatives of the Rio Urubu and Paraná do Jauató Indigenous Territories. This would not only reinforce compliance with ILO Convention 169 but also add valuable social and institutional legitimacy to the project

Leakage Management and Community-Focused Prevention

The proposed leakage belt monitoring strategy reflects a strong strategic vision to preserve the project's climate integrity. As a constructive suggestion, including a proactive engagement plan with neighboring communities — particularly within the area of indirect influence — could amplify the project's socio-environmental reach and mitigate off-site risks more effectively. Developing preventive protocols based on socioeconomic risk profiling would be an excellent complement to the current approach.

Baseline Development and Additionality Rationale

The baseline analysis and additionality assessment are well-structured and reflect a clear understanding of the land tenure and socioeconomic challenges of the region. To further reinforce this foundation, incorporating econometric modeling supported by regional datasets — such as MapBiomass, IBGE, and SIMLAM — could strengthen the counterfactual narrative and add a layer of scientific robustness to the proposed baseline scenario

Social Co-benefits and SDG Alignment

It is very encouraging to see the project's alignment with the Sustainable Development Goals, particularly SDGs 13 (Climate Action), 15 (Life on Land), and 8 (Decent Work). To further improve impact measurement, we recommend defining clear and verifiable quantitative indicators – such as the number of families trained, average household income increase, and gender equity metrics – that can be reported periodically. This would significantly strengthen the project's value proposition for ESG-focused financiers and carbon credit buyers.
