Project States: "The forest cover estimates were based on PRODES/INPE data and only included land qualifying as forest for a minimum of 10 years prior to the project start date. The Project area has no overlapping boundaries with any other project currently registered at Verra." Prodes has been showing to be not a strong dataset for REDD, also its unclear how Prodes would have been used to define the PA as this would have been provided to the proponent by Verra.

#1. Driver of deforestation identified is: Illegal logging and charcoal production - however this activity in the amazon rarely leads to deforestation as it is selective logging more in tune with degradation. Is this really a driver of deforestation?

The deforestation risks in the baseline are very generalized over the region and there is no site specific information for the drivers of deforestation. The language in the PD uses "farms" , "Region". Dow is a large industrial company required by Brazilian law to protect the forests as noted in the additionality section. If there is not site specific threat outside of the region this isnt a valid redd project.
