

XIKRIN DO CATETÉ REDD+ PROJECT

Project title	REDD+ XIKRIN DO CATETÉ PROJECT
Project ID	5565
Crediting period	29/January/2025 - 28/January/2065
Project lifetime	January 29th, 2025 - January 28th, 2065; lifespan: 40 years
(CCB) GHG accounting period	29/January/2025 - 28/January/2065; total period:40 years
Original date of issue	<i>For pipeline listing, DD-Month-YYYY is the date of submission</i> <i>For registration, DD-Month-YYYY is the date the project description was completed following the completion of the audit</i>
Most recent date of issue	<i>DD-Month-YYYY is the date on which the document was most recently submitted</i>
Version	Version 1.1
VCS Standard Version	Version 4.7
CCB Standards version	Version 3.1
Project location	Pará, Brazil
Project proponent(s)	Botiê Xikrin Indigenous Institute

Validation/verification body	N/A
History of CCB status	N/A
Gold Level Criteria	<i>List which Gold Level criteria are being used and provide a brief description of the activities planned and the expected results that enable the project to qualify for each relevant Gold Level</i>
Expected verification schedule	Initial verification in 2026
Prepared by	Amazon Connection Carbon Ltda.

1 SUMMARY OF PROJECT BENEFITS

1.1 Unique Project Benefits

Not included in the project description draft.

1.2 Standardized Benefit Metrics

Not included in the project description draft.

2 PROJECT DETAILS

2.1 Project Goals, Design and Long-Term Viability

2.1.1 Summary Description of the Project (VCS, 3.2, 3.6, 3.10, 3.11, 3.13, 3.14; CCB, G1.2)

The Xikrin do Cateté REDD+ Project is in the Xikrin do Cateté Indigenous Land, in the state of Pará, specifically within the municipalities of Água Azul do Norte, Marabá and Parauapebas. The territory understands a declared area of 439,150.54 ha (four hundred and thirty-nine thousand one hundred and fifty hectares and fifty-four acres) and it is inhabited by around 1,737 (one thousand seven hundred and thirty-seven) indigenous people of the Xikrin ethnic group, distributed in 21 villages to date.

The forest in the region has high biodiversity, with the presence of endangered species, and plays a fundamental role in regulating the climate and conserving water resources. The Xikrin people maintain a deep relationship with nature, practicing traditional activities such as hunting, fishing, seed collection and subsistence farming. The preservation of biodiversity in this context is important for the environmental balance and protection of the territory, generating socio-environmental benefits for the community.

From this perspective, indigenous sovereignty is a fundamental principle that recognizes the right of indigenous peoples to self-determination, governance of their territories and the preservation of their cultures and identities. This concept is based on respect for the autonomy of indigenous communities to make decisions about their own destinies, without external interference that compromises their identity and ancestral rights.

In the global context, indigenous sovereignty has been debated in various spheres, from national legislation to international treaties, such as the United Nations Declaration on the Rights of Indigenous Peoples (Law No. 6,001/1973). In Brazil and other nations with indigenous peoples, the struggle for sovereignty is intertwined with issues such as land demarcation and the recognition of traditional rights. Therefore, guaranteeing indigenous sovereignty not only does strengthen historical justice, but also contributes to cultural diversity and global sustainability.

Given that, it is essential to provide the means to guarantee the autonomy of the Xikrin peoples in the socio-environmental and cultural spheres, aiming to establish sustainable alternatives for generating income and subsistence that respect the specificities, skills and interests of the community.

In this context, Amazon Connection Carbon (ACC) will be responsible for implementing, developing and monitoring all stages of the project, with the active collaboration of the Instituto Botiê Xikrin (IBX), the TI's representative body. The community Xikrin do Cateté will be directly involved during the process, being able to monitor decisions and support the activities carried out. It is important to note that the revenue

from the carbon credits generated by REDD+ will contribute to biodiversity conservation, the preservation of the culture of the Xikrin people and the maintenance of their territory.

The project is classified under scope 14 - AFOLU (Agriculture, Forestry and Other Land Uses), in the category of Reducing Emissions from Deforestation and Degradation (REDD) under Unplanned Deforestation (AUD). The main objective is to reduce greenhouse gas emissions by conserving the TI's forest cover, which is currently under deforestation pressure caused by external vectors such as cattle ranching and mining activities. As well as that, valuing and preserving culture and helping to improve the community's infrastructure and quality of life are also main goals.

In addition to its impact on conservation activities in the territory, the project will be developed to meet the parameters of the Climate, Community and Biodiversity (CCB) Standards, promoting impacts beyond those provided for in REDD+, directly affecting the community's quality of life through programs that will be described in the development of the *Project Description - PD*.

In this context, the main objective of the Xikrin do Cateté REDD+ Project is to prevent deforestation of approximately 45,513 ha over the life span of 40 years (average of 1,137.825 ha/year), which corresponds to a reduction in emissions of around 44,475,409.35 tCO₂e (average of 1,111,885.23 tCO₂e/year).

2.1.2 Audit History (VCS, 4.1)

This section does not apply to the current development stage of this project.

2.1.3 Sectoral Scope and Project Type (VCS, 3.2)

Sector scope	14: Agriculture, forestry and other land uses
AFOLU Project Category	Reducing emissions from deforestation and degradation (REDD)
Project activity Type	Avoiding unplanned deforestation (AUDef)

2.1.4 Project Eligibility (VCS, 3.1, 3.6, 3.8, 3.18, 4.1; CCB Program Rules, 4.2.4, 4.6.4)

The project is eligible under sector scope 14 of the VCS, which refers to AFOLU projects. All applicable rules and requirements established by VCS Standard V4.7¹, in the REDD+ category, through AUDef activities, are met, in accordance with sections 3.1, 3.2 and A1.5 to A1.8.

According to this version of the VCS, for AFOLU projects, eligible activities are those that reduce net greenhouse gas (GHG) emissions by reducing deforestation and/or forest degradation.

The project area must be defined by the concept of forest based on the *United Nations Framework Convention on Climate Change* (UNFCCC) guidelines or the definitions of the *Food and Agriculture*

¹ VCS Standard v4.7 -

Organization of the United Nations (FAO), maintaining the characteristics of forest for a minimum period of 10 years prior to the start date of the project. Forest definitions include:

- Mature forests;
- Secondary forests;
- Degraded forests;

As detailed in section 3.2, the project also meets the eligibility criteria described in the Reducing Emissions from Deforestation and Degradation methodology VM0048² v1.0, including the tools and modules referenced by the methodology, which are eligible and approved by the VCS program.

The project proponent plans to start the pipeline listing process during 2025 and change the status to "under validation" in 2026, respecting the guidelines contained in the Registration and Issuance Process document v4.6³, sections 3.1.2 and 3.1.3.

2.1.5 Transfer Project Eligibility (VCS, 3.23, Appendix 2)

Not applied.

2.1.6 Project Design (VCS, 3.6)

Indicate if the project has been designed as:

- ☒ Single location or installation
- ☐ Multiple locations or project activity instances (but not a grouped project)
- ☐ Grouped project

2.1.6.1 Eligibility Criteria for Grouped Projects (VCS, 3.6; CCB, G1.14)

Not applied.

2.1.7 Project Proponent (VCS, 3.7; CCB, G1.1)

2.1.9 Project Ownership (VCS, 3.2, 3.7, 3.10; CCB, G5.8)

The project will take place in the Xikrin do Cateté Indigenous Land, located in the southeast of the state of Pará, within the jurisdiction of the municipality of Parauapebas and close to the urban center of Carajás, according to administrative approval decree no. 384, of December 24, 1991⁴. The area has around 439,000 hectares, with approximately 1,737 indigenous people of the Xikrin ethnic group and covers the municipalities of Água Azul do Norte, Marabá and Parauapebas.

In the legislative sphere, indigenous people have the right to free determination, i.e. they can freely define their political status and pursue their economic, social and cultural development, as advocated in Article III of the American Declaration of Indigenous Rights⁵, approved by the General Assembly of the Organization of American States. Similarly, the United Nations Declaration on the Rights of Indigenous Peoples internationally recognizes that indigenous people have control over the events that affect them and their lands, territories and resources.⁶

National guidelines such as Law No. 6.001⁷, of December 1973, provide indigenous peoples with the right to usufruct when it comes to possession, use and perception of the natural resources and all the utilities that exist on the lands they occupy, as well as the products of the economic exploitation of such

⁴ Chamber of Deputies

⁵ OAS <https://www.oas.org>

⁷ Presidency of the Republic - Civil House

natural resources and utilities. As such, they have the right to choose their territory and how to use such resources.

Following the provisions of Decree No. 10.088 of November 5, 2019 issued by the Federal Executive Branch on promulgating the International Labor Organization - ILO Convention No. 169 art. 7, indigenous peoples must have the right to choose development process that affects their lives, beliefs, institutions and spiritual well-being. As well as the land they occupy or use in any way, and control, as far as possible, their own economic, social and cultural development. In addition, they should participate in the formulation, implementation and evaluation of national and regional development plans and programs likely to affect them directly.

Based on this, from December 2024 to January 2025, the Free, Prior and Informed Consultation (FPIC) was carried out, a process in which the holders of rights over the territory were informed about the project's activities, as well as the stages and objectives to be achieved. This process culminated in the approval of the project by the community, via Public Hearing and started the permission for the elaboration and implementation of the REDD+ project in the area, following the provisions of Art. 47, I "a", of Law 15.042/2024⁸ on the FPIC process with indigenous peoples and traditional communities.

Meeting the requirements of the VCS standard demonstrates that IBX has the legal right to operate the project's activities and properties. As the social organization representing the Xikrin People of Cateté, under the terms of articles 231 and 232 of the Federal Constitution, the Institute aims to defend social rights, promote human rights, protect the forest and its communities. Thus, it confers legal credibility to its position as proponent and owner of the REDD+ project Xikrin do Cateté.

2.1.10 Project Start Date (VCS, 3.8)

Project start date	29/January/2025
Justification	The start of the project has been defined once the contract has been signed between the parties.

2.1.11 Benefits Assessment and Project Crediting Period (VCS, 3.9; CCB, G1.9)

⁸ Chamber of Deputies. - <https://www2.camara.leg.br/legin/fed/lei/2024/lei-15042-11-dezembro-2024-796690-publicacaooriginal-173745-pl.html>

Crediting period	Based on the requirements of VCS Standard 4.7, the project's accreditation period will be 40 years, being renewed every 6 years after commencement.
Start date of first or fixed crediting period	29/January/2025 to 28/January/2065
CCB benefits assessment period	Monitoring activities for the CCB will begin in 2026 with implementation, monitoring and inspection lasting 40 years, following the overall project period.

2.1.12 Differences in Assessment/Project Crediting Periods (CCB, G1.9)

Not applied.

2.1.13 Project Scale and Estimated Reductions or Removals (VCS, 3.10)

☐ < 300,000 tCO₂e/year (project)

☒ ≥ 300,000 tCO₂e/year (large project)

Calendar year of crediting period	Estimated reductions or removals (tCO ₂ e)
29/January/2025 to 28/January/2026	1.245.981,95
29/January/2026 to 28/January/2027	786.288,70
29/January/2027 to 28/January/2028	1.621.070,09
29/January/2028 to 28/January/2029	1.224.828,20
29/January/2029 to 28/January/2030	1.577.763,51
29/January/2030 to 28/January/2031	2.863.162,22
29/January/2031 to 28/January/2032	3.033.506,97
29/January/2032 to 28/January/2033	2.968.324,19
29/January/2033 to 28/January/2034	1.068.090,89
29/January/2034 to 28/January/2035	859.267,23
29/January/2035 to 28/January/2036	906.129,80

Calendar year of crediting period	Estimated reductions or removals (tCO ₂ e)
29/January/2036 to 28/January/2037	487.796,35
29/January/2037 to 28/January/2038	1.172.103,74
29/January/2038 to 28/January/2039	858.860,88
29/January/2039 to 28/January/2040	1.156.291,20
29/January/2040 to 28/January/2041	2.251.516,00
29/January/2041 to 28/January/2042	2.346.777,47
29/January/2042 to 28/January/2043	2.230.192,51
29/January/2043 to 28/January/2044	634.028,59
29/January/2044 to 28/January/2045	499.127,84
29/January/2045 to 28/January/2046	636.626,32
29/January/2046 to 28/January/2047	256.620,96
29/January/2047 to 28/January/2048	816.520,34
29/January/2048 to 28/January/2049	570.746,36
29/January/2049 to 28/January/2050	821.478,63
29/January/2050 to 28/January/2051	1.755.337,32
29/January/2051 to 28/January/2052	1.792.941,07
29/January/2052 to 28/January/2053	1.640.146,88
29/January/2053 to 28/January/2054	299.209,35
29/January/2054 to 28/January/2055	221.813,19
29/January/2055 to 28/January/2056	424.380,26
29/January/2056 to 28/January/2057	79.755,92
29/January/2057 to 28/January/2058	536.903,34
29/January/2058 to 28/January/2059	345.814,96
29/January/2059 to 28/January/2060	557.249,85

Calendar year of crediting period	Estimated reductions or removals (tCO ₂ e)
29/January/2060 to 28/January/2061	1.354.104,91
29/January/2061 to 28/January/2062	1.348.070,44
29/January/2062 to 28/January/2063	1.171.037,87
29/January/2063 to 28/January/2064	44.350,40
29/January/2064 to 28/January/2065	11.192,64
Total estimated ERRs during the first credit period or fixed credit period	44.475.409,35
Total number of years	40
Average annual ERRs	1.111.885,23

2.1.14 Physical Parameters (CCB, G1.3)

Not included in the project description draft.

2.1.15 Social Parameters (VCS, 3.18; CCB, G1.3)

Not included in the project description draft.

2.1.16 Project Zone Map and Project Location (VCS, 3.11, 3.18; CCB, G1.4-7, G1.13, CM1.2, B1.2)

Not included in the project description draft.

2.1.17 Project Activities and Theory of Change (VCS, 3.6; CCB, G1.8)

Project activities

The project is based on the Theory of Change, using the benefits of carbon credits to implement activities that promote the socio-economic and environmental development of the Xikrin community. The approach adopted seeks to balance the protection of natural resources respecting traditional ways of life, ensuring concrete and sustainable benefits for present and future generations.

To achieve these objectives, the project aims to include the following activities:

Land management	Protection of the territory and mitigation of threats by implementing effective ecosystems conservation strategies, focused on active involvement of communities in biodiversity conservation.
Development and Strengthening	Valuing traditional knowledge and local cultures, encouraging traditional education and promoting social and economic development.
Promoting community citizenship	Improved infrastructure which boasts directly the quality of life and increases access to essential services.
Biodiversity conservation	Identifying and monitoring species in the territory, including those of high conservation value. The activity aims to meet the requirements set out in the CCB Standard, as well as assessing the net conservation impacts generated by the project.

These actions, implemented in an integrated manner, aim to strengthen communities' ability to adapt to socio-environmental changes and create conditions for the continuity of sustainable practices in the long term.

Theory of Change

The Theory of Change for the biodiversity axis of REDD+ projects, as addressed by the Social and Biodiversity Impact Assessment Manual - SBIA for REDD+ projects, is described as the set of actions that will lead to the conservation of biodiversity and the high conservation values that may be identified within the territory. These actions are described through a logical chain of activities, products, results and impacts, making it possible to clearly identify how each activity will contribute to specific objectives in the short, medium and long term, contributing with the development of actions to monitor the project and its results.

For the Xikrin do Cateté indigenous land, the theory of change begins with the identification of the possible high conservation values and the threats they might be exposed to, such as deforestation, illegal poaching and territory invasions, as well as the strategies envisioned by the project to tackle with these threats. The implementation of the project's activities will lead to immediate products and measurable results in the territory dynamics. For example, strengthening community engagement and reducing deforestation by mitigating disturbances to habitats, illegal hunting and disturbance of fauna.

Given that the theory of change is based on assumptions to be explicit, it is assumed that the successful implementation of the activities and the engagement between the community, the project and possible partnerships established, will make the impact achievable in a local and participatory manner. The inclusion of joint planning with the community ensures that the Xikrins' traditional knowledge and vision of

the fauna and flora are incorporated into the project, given the cultural and ecological importance attributed to the wealth of local biodiversity.

The identification of high conservation values allows the project's activities to focus especially on species of regional, national and global importance. The presence of sensitive and threatened species in this territory makes it possible to implement the principles of the CCB, which foresee the need to maintain or increase these conservation values, avoiding any negative impacts on them.

The development of biodiversity identification and monitoring activities involve the active participation of indigenous peoples, promoting the integration of scientific methodologies and traditional knowledge. The project recognizes and values the relationship established between indigenous peoples, their territories and the natural resources, aside from their cultural, spiritual and subsistence practices.

Biodiversity conservation must be aligned to the Xikrin way of life, ensuring that their traditions are maintained and strengthened. For this reason, the project seeks to establish a sustainable relationship between environmental conservation and traditional knowledge, promoting community engagement and creating participatory strategies for monitoring and protecting the territory from external threats.

In addition, active communication with the community is essential to ensure that conservation actions contribute to food security and local population well-being, avoiding negative impacts on their way of life. Therefore, the project reaffirms its commitment to biodiversity conservation and the rights and autonomy of the indigenous people of the Xikrin do Cateté Indigenous Land.

Climate	Community	Biodiversity	Project Activity	Activity description	Climate and Biodiversity			Relevance to project's objectives
					Outputs (short term)	Outcomes (medium term)	Impacts (long term)	
			Biodiversity conservation	Forest inventory of Permanent Plots (PP)	Forest inventory report containing quantitative and qualitative variables that characterize the local vegetation	With the first measurement cycles, it will be possible to obtain more accurate data on species growth, mortality and recruitment	Understanding the effects of climate change on the forest	Quantify and qualify the forest resources of a given area, providing detailed information on the structure, composition and dynamics of the forest.

Climate	Community	Biodiversity	Project Activity	Activity description	Climate and Biodiversity			Relevance to project's objectives
					Outputs (short term)	Outcomes (medium term)	Impacts (long term)	
				Biomass quantification of above-ground tree and/or non-tree components	Forest biomass stock present at the property boundary	With continued measurements, it will be possible to better calculate carbon sequestration and its variation over time	Contributing to efficient environmental policies and certifications	Calculate the capacity to store and remove CO ₂ eq from the atmosphere
				Listing and grouping of species with the highest importance value index (IVI)	Report of species with the highest frequency, abundance and dominance in the native vegetation of the project area	It will be possible to highlight the dominant and codominant species and those with a smaller share in the forest structure	Identification of ecological succession patterns and impacts of natural or man-made disturbances	An essential metric in forest ecology, as it allows the ecological and structural relevance of plant species in a community/population to be assessed.
				Calculate diversity indices for the project area	Calculation of metrics such as species richness, Shannon-Wiener diversity, evenness and similarity	Species diversity, natural regeneration and possible changes in forest composition	Maintaining the optimum characteristics of the floristic composition present in the project area	Identify whether the forest maintains a balanced structure when compared to a reference forest

Climate	Community	Biodiversity	Project Activity	Activity description	Climate and Biodiversity			Relevance to project's objectives
					Outputs (short term)	Outcomes (medium term)	Impacts (long term)	
				List species with high conservation value found in the project area	Guidelines for the protection of endangered species	Monitor species dynamics and assess whether species high conservation value are regenerating properly	Keeping the environment in ecosystemic balance	Maintaining biodiversity, ecological balance and the sustainability of ecosystems
				Collaboration and exchange of data with research and technological development (RDT) agents	Simulations on how biodiversity can be affected by environmental factors, climate change or human activities	Research contributes to innovation in biotechnology, forest restoration and the sustainable use of natural resources	Contribute to environmental policies aimed at the sustainable management and conservation of biodiversity	Improving the process of ecological restoration and recompositing of native vegetation

Climate	Community	Biodiversity	Project Activity	Activity description	Climate and Biodiversity			Relevance to project's objectives
					Outputs (short term)	Outcomes (medium term)	Impacts (long term)	
				Monitoring forest covers conditions to reduce habitat fragmentation.	Continuous monitoring of land use and land cover dynamics through multitemporal analysis.	Conservation of habitats without fragmentation. Reducing the occurrence of patches of habitat fragmentation	Increased favorable conditions for the balance of density, occurrence and diversity of species	Compliance with forest conservation objectives and benefits generated through their implementation that have a direct impact on biodiversity conservation
				Production of reports and updated forest cover indices.		Conserving access to vital resources for species and ecological relationships.		
				Identification and monitoring of species occurring within the territory	Survey of secondary data on species occurring in and around the project area	Development of robust data on local biodiversity, promoting knowledge of the importance of land conservation	Balanced increase in the population of endangered species of local, national and global importance	Conservation of high conservation value species
					Report on biodiversity campaigns and monitoring in the project area			
					Registration and cataloging of regionally and nationally occurring species			

Climate	Community	Biodiversity	Project Activity	Activity description	Climate and Biodiversity			Relevance to project's objectives
					Outputs (short term)	Outcomes (medium term)	Impacts (long term)	
				Establishing communication channels with the community to monitor threats to biodiversity	Development of training and systematization of communication to produce reports on the occurrence of disturbances, invasions and hunting within the territory	Reducing the illegal exploitation of biodiversity species for commercial purposes	Reduced pressure from illegal hunting and disturbance of biodiversity	Maintaining and stabilizing the population of species with high conservation values
			Land management	Promote community engagement around the importance of wildlife biodiversity conservation	Training indigenous monitors in fauna identification and tracking techniques Raising awareness of key species of high conservation value Community participation in monitoring campaigns	Increased community engagement in species protection and conservation Development of a network of multipliers of knowledge about the importance of fauna among indigenous people	Active community participation in biodiversity conservation	Community empowerment over their territory and its diversity, as well as the promotion of traditional knowledge in conservation activities

Climate	Community	Biodiversity	Project Activity	Activity description	Climate and Biodiversity			Relevance to project's objectives
					Outputs (short term)	Outcomes (medium term)	Impacts (long term)	
				Development of workshops for a positive relationship between conservation and culture	Adoption of participatory workshop methods to raise awareness about management and coexistence with species of cultural value in the territory	Developing a balance between cultural traditions and biodiversity conservation	Recognizing and building a sustainable relationship between traditional peoples and the conservation of species of regional and global importance	Respect for traditional knowledge, establishing a relationship with the community and its knowledge in the pursuit of biodiversity conservation
					Community workshops to raise awareness of sustainable hunting			
					Training in subsistence hunting management			

The project's commitment to the Xikrin do Cateté indigenous community is to promote ways of improving their quality of life, strengthening their autonomy and preserving their cultural identity. The Theory of Change developed is based on dialogue with the community, based on collective engagement and participation to promote sustainable development. In this way, the project is built in partnership with the Xikrin community itself to make it possible to understand their reality, in addition to recognizing weaknesses, intrinsic opportunities and defining priorities according to the social structure. The project therefore seeks to ensure that their needs, knowledge and aspirations are respected and incorporated into the planned actions.

It should be emphasized that by committing to respecting and valuing the autonomy of the indigenous community, the REDD+ CCB project structures the conduct of all actions in a participatory, shared manner and in line with the traditional governance of the Xikrin do Cateté people, so that the community is the protagonist of its development and cultural preservation.

This project's Theory of Change proposes the implementation of effective and lasting solutions that correspond directly to the needs of the population. These actions reflect a commitment to reducing inequalities, strengthening indigenous self-determination and ensuring access to fundamental rights.

In addition, the project's premise is to provide support for the search for structural changes that will enable the Xikrin community to grow independently and sustainably. To this end, the involvement of the population in all phases of the project is crucial, from planning to execution and monitoring of impacts. The active participation of the community ensures that the interventions are culturally appropriate, in line with indigenous traditions and self-determination.

The project values the collaboration of indigenous service providers in carrying out activities, encouraging the training and employment of Xikrin professionals in the areas of health, education and community management. This approach not only stimulates the local economy but also prioritizes the fact that the services provided are carried out in partnership with those who best understand the reality and needs of the community. The table below shows the Theory of Change developed to achieve the social transformations proposed by the project:

Climate	Community	Biodiversity	Project activity	Description of the activity	Social Expectations			Relevance to the project's objectives
					Outputs (short term)	Results (medium term)	Impacts (long term)	
			Developing and strengthening social	Training community members to improve financial planning and management	Engaging the community in courses and workshops on financial management	Applying the knowledge acquired to better manage their individual or collective resources	Greater decision-making capacity in the management of the Xikrin's financial resources in accordance with established governance	Improved management of financial resources, stimulating economic stability in the community

Climate	Community	Biodiversity	Project activity	Description of the activity	Social Expectations			Relevance to the project's objectives
					Outputs (short term)	Results (medium term)	Impacts (long term)	
				Female empowerment through training in entrepreneurship and sustainable business	Participation of indigenous women in training and workshops	Creating a sustainable business plan and expanding opportunities	Greater female protagonism and financial independence for Xikrin women	Gender equality and increased economic autonomy for indigenous women
				Strengthening the leaders of the Xikrin do Cateté Indigenous Territory through courses, workshops and training.	Training leaders prepared to defend the rights of the community	Leadership active and engaged in the protection of indigenous rights and resource management	Strengthening indigenous self-determination and greater action in defense of indigenous peoples	Increasing the self-management and governance skills of the TI Xikrin do Cateté
			Promoting community citizenship	Improving access to education by expanding technical courses, higher education and professional training	Community engagement for new educational opportunities and technical courses	Increased school completion rates and entry into higher education	More qualified indigenous community, reducing economic and social barriers	Improving the academic and vocational training of indigenous people

Climate	Community	Biodiversity	Project activity	Description of the activity	Social Expectations			Relevance to the project's objectives
					Outputs (short term)	Results (medium term)	Impacts (long term)	
				Expanding access to health services, facilitating quality care and promoting greater equity in community care	Establishing partnerships with local health services and support	Promotion of preventive health practices and health education	Improving collective health and increasing access to services	Promoting general well-being and improving living conditions, with a focus on the community's quality of life
				Improving practices for the treatment, reuse and proper disposal of solid waste and strengthening community management	Participatory diagnosis of waste generation and disposal and strengthening environmental awareness in the community	Creation of waste collection and separation points. Reducing inappropriate waste disposal.	Improving community health and well-being	Promoting environmental sustainability with a focus on collective health and community well-being
				Food education by raising awareness about healthy eating and reviving traditional practices	Implementation of food education and nutrition training workshops	Reducing consumption of foods	Preservation of traditional food culture, improving the general health of the community, prioritizing food produced by the community itself	Reducing metabolic diseases such as diabetes and high blood pressure, as well as strengthening food security

Climate	Community	Biodiversity	Project activity	Description of the activity	Social Expectations			Relevance to the project's objectives
					Outputs (short term)	Results (medium term)	Impacts (long term)	
				Encouraging the agro-ecological transition, with the rescue and adoption of more sustainable agricultural practices	Greater community participation in training and workshops with relevant themes	Implementation of more sustainable agricultural practices and diversification of local production	Strengthening production systems with a focus on sustainability and regeneration	Improving food production to increase access to food and ensure food security
				Boosting sports practices by maintaining sports venues, encouraging championships and sports workshops	Greater community participation in sporting events	Greater engagement in sports activities and strengthening of social integration	Reduction of diseases related to sedentary lifestyles and greater community unity	Promoting physical and mental health and strengthening community socialization

The project is also committed to respecting the basic rights of the Xikrin, such as access to health, education and food security, improving the community's well-being, as well as complying with the Cancún safeguards.

In the long term, the set of initiatives aims to consolidate these benefits for the Xikrin do Cateté indigenous community, with results that will have a positive impact on future generations. Active community participation, valuing indigenous service providers and respect for the customs of the Xikrin do Cateté community are the key elements that mark the implementation of this project.

In the context of preserving and valuing Xikrin culture, the project structures actions that strengthen the transmission of ancestral knowledge, the holding of traditional festivals and the training of indigenous leaders. The development of cultural workshops, historical records and integration between communities contributes to the appreciation of traditional knowledge. The table below shows the main results sought

and their long-term impact, demonstrating how the actions will contribute to the cultural autonomy and identity of the Xikrin people.

WeatherClimate	Community	Biodiversity	Project activity	Description of the activity	Cultural expectations			Relevance to the project's objectives
					Outputs (short term)	Results (medium term)	Impacts (long term)	
			Developing and strengthening the socio-economy	Support for festivals and sacred ceremonies. Encouraging the oral transmission of ancestral knowledge and supporting the preservation of sacred spaces	Resources for performing traditional ceremonies and strengthening spiritual practices	Greater engagement of the community, especially young people, in participating in rituals and customs to ensure the continuity of their traditions	Strengthening the Xikrin's spiritual relationship with the forest and preserving their culture for future generations	Preservation of indigenous rituals with the rescue and valorization of the spiritual and cultural practices of the Xikrin
				Promoting the TI's cultural festivals by organizing annual events, artistic workshops and traditional performances, such as dances, songs, narratives and handicrafts.	Holding cultural festivals and workshops with broad community participation	Engagement of young people in culture and greater recognition of the importance of customs for the community	Preserving the Xikrin culture and strengthening the sense of identity and cultural belonging	Strengthening cultural identity and valuing traditional artistic expressions

WeatherClimate	Community	Biodiversity	Project activity	Description of the activity	Cultural expectations			Relevance to the project's objectives
					Outputs (short term)	Results (medium term)	Impacts (long term)	
				Recording the history of the Xikrin people from Cateté by developing written, audiovisual and digital records of their culture and history	Creation of documentary materials on the culture and history of the Xikrin	Young people and community members engaged with the records for learning and cultural transmission	History and traditions of the Xikrin preserved for future generations, ensuring cultural continuity	Preserving ancestral knowledge and strengthening indigenous identity
				Promoting the participation of the Xikrin do Cateté community in other external spaces	Greater participation by the Xikrin in inter-community and other events	Strengthened cultural exchanges and the creation of support networks between different indigenous ethnic groups	Boosting the strength of indigenous peoples, promoting their autonomy and recognition in Brazil	Strengthening indigenous identity and the fight for their rights

2.1.18 Sustainable Development Contributions (VCS, 3.17)

The TI Xikrin do Cateté Project proposes to carry out activities aimed at contributing to the following United Nations Sustainable Development Goals (SDGs): 2; 3; 4; 5; 8; 11; 13; 15.

Sustainable Development Goals (SDGs)	Contribution of the Xikrin do Cateté REDD+ Project
	Strengthening traditional land use activities, such as indigenous family farming to diversify and increase income, guaranteeing food security and providing greater autonomy for communities in the territory.
	Improving access to basic health and well-being services, thus seeking to guarantee a healthy life and promote well-being for all age groups.
	Improving access to inclusive and continuous education and promoting learning opportunities that respect and value local traditional knowledge.
	Increasing the participation of indigenous women and girls in actions, promoting equal opportunities and ensuring their representation at all levels of decision-making and leadership.
	Encouraging job creation and income diversification in the indigenous community, through sustainable and community-based alternatives, promoting local economic development and autonomy.
	Strengthen efforts to protect and preserve the cultural and natural heritage of indigenous territories, ensuring the sustainability and resilience of communities.
	Implementing actions to combat climate change and its impacts, by reducing deforestation in the territory and, consequently, reducing greenhouse gas emissions. Thus, both mitigation and adaptation actions will be implemented, with the aim of minimizing the impacts of global warming and promoting the resilience of local communities and ecosystems.

Sustainable Development Goals (SDGs)	Contribution of the Xikrin do Cateté REDD+ Project
	Protecting, restoring and promoting the sustainable use of terrestrial ecosystems, with practices that ensure the preservation of fauna and flora, as well as promoting the abundance of species.
	Strengthen action capacities and expand partnerships for sustainable development, cooperating in an integrated manner to tackle global challenges and promote effective and equitable solutions.

The above objectives are interconnected and present global challenges for the development of actions that strengthen and improve the living conditions of the Xikrin Community, while promoting the conservation of natural resources, including the fauna and flora present in their territory.

Activities will be monitored and results reported using quantitative and qualitative indicators, ensuring that environmental, social and economic impacts are recorded and evaluated on an ongoing basis.

This project consolidates itself as a model of conservation integrated with sustainable development, ensuring that the benefits generated improve people's quality of life, protect the environment and promote a sustainable future for generations to come.

2.1.19 Implementation Schedule (CCB, G1.9)

Not included in the project description draft.

2.1.20 Risks to the Project (CCB, G1.10)

Not included in the project description draft.

2.1.21 Benefit Permanence (CCB, G1.11)

Not included in the project description draft.

2.1.22 Financial sustainability (CCB, G1.12)

Not included in the project description draft.

2.2 Without-project Land Use Scenario and Additionality

2.2.1 Conditions Prior to Project Initiation and Land Use Scenarios without the Project (VCS, 3.13; CCB, G2.1)

The Xikrin do Cateté Indigenous Land is in the state of Pará, covering the municipalities of Água Azul do Norte, Marabá and Parauapebas. With a territorial extension of 439,000 hectares (four hundred and thirty-nine thousand hectares), the area is inhabited by 1,737 indigenous people, distributed in 21 villages date.

The Indigenous Land, characterized by its highly biodiverse rainforest, plays a crucial role in regulating the climate and conserving water resources. In addition to its ecological importance, the TI has a significant influence on the preservation and continuity of the culture of the Xikrin people.

This region falls into climate group A (tropical) and classification Af (equatorial forest climate), according to the Köppen-Geiger classification. These climates are considered Mega thermic, with average temperatures above 18 °C in all months of the year, with no defined winter season. In terms of humidity, the annual rainfall exceeds the annual potential evapotranspiration⁹, which guarantees high levels of humidity throughout the year.

On average, 76% in September, when rainfall is low (less than 100 mm per month) and 87% in March, when rainfall is heaviest (over 250 mm).

However, in the year 2024, INMET (2024) recorded the driest period occurring in the months of August, September and October, with average highs of approximately 32 °C, and the wettest period in January, February and March, with average lows of approximately 22 °C, as shown in graph 1.

⁹ National Institute of Meteorology INMET - 2024

Source: INMET, 2024

Topography

The Xikrin do Cateté Indigenous Land is in a region with heterogeneous topography, with relief that includes plains, hills and mountain formations, as shown in Figure 1. Altitudes vary from 34.8 meters to 903.7 meters above sea level, with an average of approximately 250 meters. This topographical diversity directly influences the local ecosystems, contributing to the rich biodiversity present in the Xikrin territory. Among the relief features, the Serra dos Carajás stands out, reaching altitudes of over 900 meters and representing one of the highest points in the region.

Figure1 - Elevation of the Xikrin do Cateté Indigenous Land, covering the municipalities of Parauapebas, Água Azul do Norte and Marabá, in the state of Pará, Brazil.

Source: Amazon Connection Carbon, 2024.

Soils

The soil type present in the Project Area is made of three soil classes, Ultisol (Argissolo), Nitosol (Nitossolo) and Entisol (Neossolo), with the predominant one being Dystrophic Red-Yellow Ultisol, covering 88.19% of the indigenous territory, while 9.02% is Entisol and 2.79% Nitosol, as shown in figure 2. Each class has specifications that distinguish them from each other:

- Dystrophic Red Yellow Ultisol: Clayey texture and colors ranging from red to yellow, resulting from the presence of iron oxides such as hematite and goethite. It has low natural fertility and high acidity and is common in areas of gently undulating to strongly undulating terrain. Its water retention capacity is moderate, and drainage is generally good.
- Eutrophic Red Nitosol: Intense red color, clayey to very clayey texture and well-developed blocky structure. Derived from basic and ultrabasic rocks, it has high natural fertility due to its high base saturation. It is deep, well-drained and has a good water retention capacity, making it suitable for various agricultural activities.

- **Dystrophic Lithic Neosol:** Characterized by being shallow, with little effective depth, this soil has a varied texture, generally sandy or sandy loam. It has low natural fertility and high acidity. Due to its limited depth and water retention capacity, it is less suitable for intensive agricultural activities and is more common in areas of rugged terrain.

Knowledge of the characteristics of these soils is fundamental to understanding the factors that affect the maintenance of organic carbon in the soil, as well as implementing more sustainable practices in areas for anthropogenic use.

Figure2 - Types of soil found in the Xikrin do Cateté Indigenous Land.

Source: Amazon Connection Carbon, 2024.

Hydrography

The territory is bathed by a hydrographic network formed by various watercourses, such as the Rivers of Cateté and Itacaiúnas, which play a crucial role in the local ecosystem and in the life of the indigenous community. The rivers, especially the Cateté, have deep links with the history and culture of the Xikrin people.

The river is an essential source of food for the community, providing sustenance through the Xikrin's traditional collective fishing, as well as being fundamental in the food preparation process. The rivers shown in figure 3 are described below:

- **Cateté River:** The main watercourse running through the Xikrin do Cateté Indigenous Land, the Cateté River is a tributary of the Itacaiúnas River. Historically, it has been essential for the subsistence and culture of the Xikrin people.
- **Itacaiúnas River:** Although it does not cross the Indigenous Land directly, the Itacaiúnas River is an important tributary of the Tocantins River and receives the waters of the Cateté River. It rises in the Serra da Seringa, in the municipality of Água Azul do Norte/PA, and flows into the left bank of the Tocantins River, in the city of Marabá/PA. The Itacaiúnas is approximately 390 km long with a watershed of around 42,000 km².
- **Aquiri River:** Another tributary of the Itacaiúnas River, the Aquiri River flows close to the boundaries of the Xikrin do Cateté Indigenous Land. Although it does not directly cross the indigenous territory, its proximity makes it important for the local ecosystem.
- **Seco River:** This river crosses the Xikrin do Cateté Indigenous Land, contributing to the drainage of the region. Detailed information on its specific characteristics is limited, but its presence is significant for the local hydrography.
- **Pium River:** It flows close to the boundaries of the Indigenous Territory and is one of the tributaries that make up the regional hydrographic basin. Its direct influence on the indigenous territory is limited, but it contributes to the area's water balance.
- **Piranhas Stream:** A small watercourse that also runs close to the boundaries of the Xikrin do Cateté Indigenous Land. Although smaller, it plays a role in local drainage and the maintenance of adjacent ecosystems.

The conservation of watercourses is fundamental both for the maintenance of the traditional way of life of the Xikrin people and for the conservation of regional biodiversity.

Figure3 - Hydrography of the Xikrin do Cateté indigenous land.

Type of vegetation

The vegetation in the project area is predominantly formed by Submontane Open Ombrophilous Forest with Lianas and Submontane Open Ombrophilous Forest with Palms, as well as other types of vegetation with less coverage. The region is made up of a diversity of plant formations, reflecting the local ecological richness. The main plant formations present, as identified in Figure 4, are:

- **Submontane Open Ombrophilous Forest with Lianas:** It is characterized by a more open forest cover, with spaced trees and a significant presence of lianas that interconnect the canopies. This formation occurs at altitudes of between 100 and 600 meters and is associated with areas with more pronounced dry periods of more than 60 days a year.
- **Submontane Open Ombrophilous Forest with Palm Trees:** Like the previous one, but with a predominance of palm trees in the arboreal layer. This formation is common in transition areas between the Amazon Rainforest and extra-Amazon regions, occurring at similar altitudes and under climatic conditions that include longer dry periods.

- Submontane Dense Ombrophilous Forest with Emergent Canopy: It features denser vegetation, with large trees that form a continuous, emergent canopy and can reach heights of over 30 meters. This formation occurs at altitudes between 100 and 600 meters.
- Pastures and Other Crops: In smaller areas, there are pastures and agricultural crops, the result of anthropogenic activities that have modified the original vegetation for agricultural use.

This diversity of plant formations contributes to the ecological richness of the Xikrin do Cateté Indigenous Land, providing varied habitats that support a rich biodiversity and play essential roles in maintaining local ecosystem services.

Figure4 - Types of vegetation that occur in the Xikrin do Cateté Indigenous Land.

Source: Amazon Connection Carbon, 2024.

Historical context

According to the records of the Xikrin people themselves, their activities involve farming, hunting, fishing, collecting seeds, among other things, based on traditional knowledge accumulated over generations, especially those grown for family consumption. The foods grown are diverse, including sweet

potatoes, cassava, yams, as well as grains such as corn and other crops that complement production. The species have cultural and utilitarian value and are used to make everyday objects.

In general, the most widely used traditional practice for growing these foods is through the opening of swiddens by slash-and-burn agriculture, an agricultural technique introduced to the Indigenous Lands by non-indigenous people that involves the controlled cutting and burning of vegetation. This method begins with the drilling and felling stage, happening in May and June, when the soil is prepared to receive the propagation materials. This is followed by burning, a traditional practice when the first rains help control the fire in October, followed by planting and management.

Maintaining this biodiversity is of great importance for the environmental balance and preservation of this territory, providing economic and social benefits to the community. The Xikrin people have a deep relationship with nature, practicing their traditional activities and using nature to perform their rituals.

However, historically, the Xikrin people have faced major problems such as river pollution, deforestation and the negative actions of loggers, miners and land grabbers. As a result of the illegal activities that take place around the TI area, the waters of the Cateté River, considered the main river for the community, are contaminated, with levels found above those recommended by the National Environmental Council (CONAMA) for iron, chromium, copper and nickel. The contamination has affected the traditional diet of the indigenous people who need the river to collect and prepare their food, such as fish, manioc flour and sweet potatoes, consequently damaging the community's health.

Surrounding areas

The map (Figure 5) illustrates the main economic activities in the municipalities surrounding the Xikrin do Cateté Indigenous Land, such as Marabá, Parauapebas and Água Azul do Norte. These municipalities are experiencing a boom in agricultural and mining activities, sectors responsible for increasing the region's Gross Domestic Product (GDP).

Figure5 - Main economic activities taking place around the Xikrin do Cateté Indigenous Land

Source: Amazon Connection Carbon, 2025

According to IBGE, because of the growing expansion of economic activities over the 10-year period, Marabá was the municipality that grew the most in terms of GDP, followed by Parauapebas and Água Azul do Norte, as can be seen in Graph 2.

Graph2 - GDP growth in the municipalities of Parauapebas, Marabá and Água Azul do Norte.

Source: IBGE.

Growth in the municipality of Marabá is driven by industry, which accounts for 62% of local GDP, followed by Parauapebas, where 87% of GDP is focused on this same activity. Meanwhile, the municipality of Água Azul do Norte's main activity is agriculture, with a 56% share of GDP (IBGE, 2021), as shown in Graph 3.

Graph3 - Distribution of GDP in the municipalities of Marabá, Parauapebas and Água Azul do Norte.

Source: IBGE, 2021.

In the municipality of Marabá, mineral extraction stands out as one of the main economic activities, with copper being the most extracted ore, as well as other minerals such as manganese and iron. Agriculture also plays an important role in the local economy, with pastureland occupying 53.05% of the productive area, while agriculture accounts for just 0.2%, especially soy, rice and corn (MapBiomas, 2023).

In Parauapebas, mining generates significant returns for the municipality and, consequently, for the state. However, farming and cattle raising accounts for 1%, with productive activity occupying approximately 0.14% of the municipality's total area.

In the municipality of Água do Norte, farming occupies 61.3% of the total area. This activity is mainly driven by beef cattle farming, with vast areas for cattle breeding. In addition to agriculture, the municipality also has a significant mining sector, with the extraction of copper, lead, zinc and other non-ferrous minerals.

Likely Scenario without the Project

In the figure below, it is possible to identify the land use and land cover around the TI, corresponding to parts of the areas of the municipalities studied. The pasture and mining areas are points of attention, representing 295,220 and 4,686 hectares, respectively, of the surroundings from a 20 km buffer. The presence of these activities near the Indigenous Land intensifies environmental and social impacts, requiring mitigation strategies.

Figure6 - Land use and cover around the Xikrin do Cateté Indigenous Land.

Source: Amazon Connection Carbon, 2024.

In the most recent IBGE survey, livestock farming proved to be a significant activity in the municipalities of Marabá and Água Azul do Norte, with a growth in the cattle herd over the 13 years analyzed, predicting a possible increase in the following years, as can be seen in Graph 4.

Graph4 - Evolution of the cattle herd in the municipalities of Parauapebas, Marabá and Água Azul do Norte.

Source: IBGE.

Due to the expansion of farming and mining activities in the municipalities that encompass the Indigenous Land, the implementation of a REDD+ project has emerged as a strategic solution for environmental conservation and the strengthening of indigenous peoples. The project will bring benefits through the protection of the forest in the territory, avoiding changes in land use. It will also bring financial benefits through the sale of carbon credits invested in indigenous communities.

Not included in the project description draft.

2.5 Legal Status and Property Rights

2.5.1 National and Local Laws (VCS, 3.1, 3.6, 3.7, 3.14, 3.18, 3.19; CCB, G5.6)

- Constitution of the Federative Republic of Brazil of 1988¹⁰, especially articles 225, which deals with the environment, and 231, which regulates the rights of indigenous peoples. The Federal Constitution represents the highest regulation in the Brazilian legal system, and it is the reference for all subsequent normative acts. The project is guided by this statute, accordingly, observing both the constitutional rules on environmental preservation and sustainable development, and the provisions of the Constitution that protect the rights of indigenous communities.
- Law n. 6.001/1973¹¹, reflecting what is stipulated in article 231 of the Federal Constitution, states that the lands traditionally occupied by indigenous people are destined for their permanent possession and exclusive usufruct, guaranteeing them territorial protection and decision-making autonomy. To guarantee this right, the project will be executed in partnership with the community, which decided to join the project after extensive community consultation.
- The Convention 169 of the International Labor Organization¹², although of an international nature, is widely used in Brazil as a reference to safeguard the right of indigenous communities to Free, Prior and Informed Consultation as a prerequisite for their decision-making, which was notably respected by the developer in the preliminary stage of the project, having hired, at its sole expense, an independent consultancy that conducted the consultation process with all the villages of the Xikrin Indigenous People of Cateté, ending with a public hearing held with the massive presence of the community.
- The Law n. 9.795/1999¹³, which stipulates the National Environmental Education Police and provides for its dissemination and implementation on a wide scale, including traditional communities, being applied in the project by the developer in the presentation of the benefits of carbon credit projects, above all based on the interdependence between the natural, socio-

¹⁰ Constitution of the Federative Republic of Brazil, 1988 -

¹¹ Law No. 6.001, of December 19, 1973 -

¹² ILO Convention 169 on Indigenous and Tribal Peoples -

¹³ Law No. 9.795, of April 27, 1999 -

economic and cultural environment, under the focus of sustainability and the recognition and respect for plurality.

- The Decree n. 6.040/2007¹⁴, which establishes the National Policy for the Sustainable Development of Traditional Peoples and Communities, which also serves as a reference for the protection of indigenous peoples' rights, and is observed in the project because it is promoting, as a collateral benefit, the improvement of the quality of life of the Xicrin do Cateté Indigenous People on an intergenerational basis, always preserving their community autonomy.
- The Law n. 15.042/2024¹⁵, which created the Brazilian Greenhouse Gas Emissions Trading System, regulating the carbon credits market in Brazil, which, although it was issued during the pre-project stages and is still being implemented by Brazil, has already been fully applied by the developer, especially with regard to the rights of the traditional community involved and their due safeguards, with decision-making autonomy.

2.5.2 Relevant Laws and Regulations Related to Workers' Rights (VCS, 3.18.2; CCB, G3.11)

The Consolidation of Labor Laws (Decree-Law No. 5,452/1943¹⁶) is the main Brazilian standard regulating labor relations and labor rights and is fully complied with by the developer in all the labor relationships it maintains, including employees in the strict sense and freelance service providers.

2.5.3 Human Rights (VCS, 3.19)

The protection of human rights is one of the value bases of the project developed by ACC, which, in particular, has the basic premise of guaranteeing the protection of the rights of the Xikrin do Cateté Indigenous People, who played a leading role in the entire process of building the project, starting with a broad Free, Prior and Informed Consultation (FPIC), through which the project and the company were presented to the community, exposing possible benefits and associated risks, so that they could make decisions autonomously and safely, which was carried out at a public hearing with broad community participation. Furthermore, in its development, the project aims to safeguard that the Indigenous People make the most of the benefits they will receive, investing in intergenerational improvements for the community that contribute to their well-being while preserving their culture and ancestry.

2.5.4 Indigenous Peoples and Cultural Heritage (VCS, 3.18, 3.19)

¹⁴ Decree No. 6.040, of February 7, 2007 -

¹⁵ Law No. 15.042, of December 11, 2024 -

¹⁶ Decree - Law No. 5.452, of May 1, 1943 -

As stated, the project is based on the protection of the Xikrin do Cateté Indigenous People and respect for their culture, giving them maximum benefit so that, with their own autonomy and governance, they can preserve their culture, improve their quality of life and be better protected from external pressures against their self-determination.

2.5.5 Statutory and Customary Property Rights (VCS, 3.18, 3.19; CCB, G5.1)

As this is indigenous land traditionally occupied by the Xikrin do Cateté People, the Brazilian Federal Constitution, in its article 231, §2, stipulates that the community has permanent possession and exclusive usufruct over the area, which will be respected absolutely by ACC, which will develop the project in partnership with and for the benefit of the Xikrin do Cateté People, who had the autonomy to define the boundaries of the project based on the data presented to them, in to fully maintain their territorial autonomy, especially with regard to use for maintaining their way of life.

2.5.6 Recognition of Property Rights (VCS, 3.7, 3.18, 3.19; CCB, G5.1)

The indigenous land traditionally occupied by the Xikrin do Cateté People is duly demarcated and formally registered as their exclusive usufruct, with the community having decision-making freedom to develop activities within it, including REDD+ projects, which will be carefully observed by Amazon Connection Carbon.

2.5.7 Free, Prior and Informed Consent (VCS, 3.18; CCB, G5.2)

Description of process for obtaining consent	The <i>Xikrin do Cateté Indigenous People</i> were widely consulted about their interest in developing the project in partnership with ACC, in a process of Free, Prior and Informed Consultation that was funded by ACC, but developed with total technical and scientific autonomy by the Tamaquaré ESG consultancy (Carvalho Domingues Consultoria e Serviços em ESG Ltda.). The consultancy happened on the indigenous land and made careful contact with all the component villages of the Xikrin do Cateté People, explaining the particularities of the project and the possible consequences for each possible choice to be made by the community. After this consultation, the process was finalized with a public hearing held in the Cateté Village, with broad community participation and approval of the project.
Outcome of FPIC process	The result of the CLPI was positive, with the community raising their main doubts at a public hearing for clarification by the Tamaquaré ESG consultancy Discussion among its own members and exposure of the main risks identified during the FPIC process, culminating in the approval of the project and the contracting of ACC. As a product, a service contract was drawn up which broadly protects the territorial rights of the Xikrin of Cateté People over their land, guaranteeing their right to continue using the area according to their customs and way of life, with ACC being responsible for monitoring the area to ensure that the development of the project remains compatible with this purpose

2.5.8 Benefit Sharing Mechanisms (VCS, 3.18, 3.19;)

Process used to design the benefit sharing plan	The process of sharing benefits followed the pattern established by Law 15.042/2024, stipulating that the community will be entitled to 70% (seventy percent) of the carbon credits generated by the project developed in its territory.
Summary of the benefit sharing plan	In general, the agreement fully complied with the provisions of Law 15.042/2024, especially regarding safeguards for indigenous rights, with ACC, as the developer and investor, being responsible for funding the tasks required to make the project operational.
Approval and dissemination of benefit sharing plan	This agreement was previously disclosed in the FPIC, reiterated in a deliberative meeting and in a reading carried out internally and according with the community at all these stages.

2.5.9 Property Rights Protection (VCS, 3.18, 3.19; CCB, G5.3)

The project will be executed on the Xikrin do Cateté Indigenous Land, following a REDD+ mechanism based on the conservation of space, and in no way depending on the removal or displacement of the indigenous people, who will have their territorial and ownership autonomy preserved, as well as the development of their traditional way of life.

2.5.10 Illegal Activity Identification (VCS, 3.19; CCB, G5.4)

The project will be subject to constant monitoring against possible illegal uses of the territory, including invasions and deforestation, in an activity that will be led by the ACC, which, together with the community, undertakes to immediately report any illegalities that it may identify, not only with regard to land and environmental violations, but also with regard to illegalities associated with forced labor, child labor and human trafficking, which are strictly forbidden in the project and, more than that, diverge from the very value bases proposed by the ACC.

2.5.11 Ongoing Disputes (VCS, 3.18, 3.19; CCB, G5.5)

No ongoing disputes associated with the land, territory or resources held there have been identified, so, in principle, the project will not interfere in the outcome of any discussions in this regard. However, in a zealous manner, ACC, as the developer, will continue monitoring possible risks in this regard, in order to avoid impacts on the project and, above all, on the Xikrin do Cateté People.

2.5.12 Approvals (CCB, G5.7)

The project followed the provisions of the Brazilian Federal Constitution and the rules established by the Law 15.042/2024. In addition to obtaining the approval of the community itself, which is the main stakeholder, it communicated with various entities about the realization of the FPIC and the results obtained.

These entities include the Federal Public Prosecutor's Office, the National Foundation for Indigenous Peoples and the Ministry of Indigenous Peoples, which were invited to participate and supervise the process. It is important to note that CONAREDD+ was informed that the Xikrin do Cateté People chose to continue with the project independently, and not as part of the Pará State jurisdictional program. According to the Law 15.042/2024, the community has decision-making autonomy to adopt this position, and there is no need to obtain authorization, only to communicate for the purposes of awareness and possible supervision. This procedure was duly complied with by ACC.

2.5.13 Double Counting and Participation under Other GHG Programs (VCS, 3.23; CCB G5.9)

2.5.13.1 No Double Issuance

Is the project receiving or seeking credit for reductions and removals from a project activity under another GHG program, or any other form of community, social or biodiversity unit or credit?

☐ Yes ☒ No

2.5.13.2 Registration in Other GHG Programs

Has the project been registered in any other GHG program?

☐ Yes ☒ No

Is the project active under the other program?

☐ Yes ☒ No

2.5.13.3 Projects Rejected by Other GHG Programs

Has the project been rejected by any other GHG program?

☐ Yes ☒ No

2.5.14 Double Claiming, Other Forms of Credit and Scope 3 Emissions (VCS, 3.24)

2.5.14.1 No Double Claiming with Emissions Trading Programs or Binding Emission Limits

Are project reductions and removals or project activities also included in an emissions trading program or binding emission limit? See the VCS Program Definitions for definitions of emissions trading program and binding emission limit.

☐ Yes ☒ No

2.5.14.2 No Double Claim with Other Forms of Environmental Credit

Has the project activity sought, received, or is planned to receive credit from another GHG-related environmental credit system? See the VCS Program Definitions for definition of GHG-related environmental credit system.

☐ Yes ☒ No

2.5.14.3 Supply Chain (Scope 3) Emissions

Do the project activities affect the emissions footprint of any product(s) (goods or services) that are part of a supply chain?

☐ Yes ☒ No

Are the project proponent(s) or authorized representative a buyer or seller of the product(s) (goods or services) that are part of a supply chain?

☐ Yes ☐ No

Has the project proponent(s) or authorized representative posted a public statement on their website saying: "Carbon credits may be issued through the Verified Carbon Standard [project ID] project for the greenhouse gas emissions reductions or removals associated with [name(s) of project proponent(s) or authorized representative organization] [name of product(s) whose emissions footprint is altered by project activities]."?

☐ Yes ☐ No

2.6 Additional Information Relevant to the Project

2.6.1 Leak Management (VCS, 3.11, 3.15)

Not included in the project description draft.

2.6.2 Further information

Not included in the project description draft.

3 CLIMATE

3.1 Application of Methodology

3.1.1 Title and Reference of Methodology (VCS, 3.1)

Type (methodology, tool, module)	Reference ID (if applicable)	Title	Version
Methodology	VM0048	Reducing Emissions from Deforestation and Forest Degradation	1.0
Module	VMD0055	Estimation of Emissions Reductions from Avoiding Unplanned Deforestation	1.1
Module	VMD0001	Estimation of carbon stocks in the above and below-ground biomass in live tree and non-tree pools (CP-AB)	1.2
Module	VMD0003	Estimation of carbon stocks in the litter pool (CP-L)	1.1
Module	VMD0004	Estimation of stocks in the soil organic carbon pool (CP-S)	1.1
Module	VMD0016	Methods for stratification of the project area (X-STR)	1.3
Tool	VT0001	Tool for the Demonstration and Assessment of Additionality in VCS AFOLU Project Activities	3.0
Tool	VT0007	Unplanned Deforestation Allocation (UDef-A)	1.0

3.1.2 Applicability of Methodology (VCS, 3.1)

Reference ID/Title	Applicability condition	Justification of conformance
VM0048	Activities eligible under REDD are those that reduce GHG emissions by reducing deforestation and/or forest degradation.	The project's activities are described in section 1.1.17 of the document and their main objective is to reduce forest deforestation, considering the threats posed by deforestation agents.
	The activities covered by the REDD project category are those designed to prevent planned deforestation or unplanned deforestation and/or degradation.	
	The project area must meet an internationally accepted definition of forest, such as those based on host country boundaries under the UNFCCC or FAO definitions.	The project area meets the FAO definition of forest, as it has vegetation cover measuring more than 0.5 ha, as well as canopy cover of more than 10% or trees capable of achieving these parameters.
	The project area must qualify as a forest for at least 10 years before the project start date.	The project area has been classified as a forest for more than 10 years prior to the project start date.
VMD0055	Forested wetlands, such as floodplain forests, peatland forests and mangroves, are also eligible, if they meet the forest definition requirements.	There are no floodplain forests, peatland forests or mangroves, and the vegetation cover categories do not fall into the wetland categories.
	Applicable if: 1) The land use transition in the baseline scenario is forest land to non-forest land, meeting the definition of unplanned deforestation.	The baseline scenario is the transition from forest land to non-forest land, with the agents of deforestation being the expansion of areas for agricultural and livestock production

Reference ID/Title	Applicability condition	Justification of conformance
	2) The project involves activities designed to prevent unplanned deforestation. 3) The agents of deforestation in the baseline scenario clear land for tree harvesting, settlements, roads, unauthorized expansion of roads or other infrastructure, agricultural production, livestock or aquaculture.	Project activities, then, are designed to prevent unplanned deforestation in the project area.
	Not applicable if: 4) The project harvests trees to generate income, fiber or fuel. 5) More than two percent of the vegetation cover in the project area is peat bog or tidal marsh vegetation. 6) Wetlands are being drained in the baseline scenario or wetland drainage occurs in the project scenario. 7) More than ten percent of the vegetation cover in a 10-kilometer-wide buffer around the project area is peatland or tidal marsh vegetation. 8) Mitigation measures include: a. Flooding agricultural land to increase production, or	4) The project does not include harvesting activities to generate income, fiber or fuel. 5) There are no peat bogs or tidal marsh vegetation identified in the project area. 6) There are no wetlands identified in the project area. 7) There is no evidence of peat bog or tidal marsh vegetation in the 10 km buffer around the project area. 8) The project's mitigation measures do not include activities such as flooding agricultural land to increase production or intensifying livestock production using feedlots and/or manure lagoons.

Reference ID/Title	Applicability condition	Justification of conformance
	b. Intensify livestock production using feedlots and/or manure lagoons.	
VT0001	AFOLU activities that are the same as or like the proposed project activity on the land within the proposed project boundary, carried out with or without registration as the VCS AFOLU project, must not lead to a violation of any applicable law, even if the law is not enforced.	The proposed project and its activities within the project area comply with national and local government laws.
	Using this tool to determine additionality requires the baseline methodology to provide a step-by-step approach that justifies determining the most plausible baseline scenario.	The approach to justifying the most plausible baseline scenario is presented in topic 2.2.1 of the <i>Project Description</i> , following the criteria for eligibility of the selected methodology and demonstrating the need to implement the project.
	The project proponent(s) proposing new baseline methodologies must ensure consistency between the determination of a baseline scenario and the determination of the additionality of a project activity.	

3.1.3 Project Boundary (VCS, 3.12)

Not included in the project description draft.

3.1.4 Baseline Scenario (VCS, 3.13)

Not included in the project description draft.

3.1.5 Additionality (VCS, 3.14)

Not included in the project description draft.

3.1.5.1 Regulatory Surplus (VCS, 3.14)

Is the project located in an UNFCCC Annex 1 or Non-Annex 1 country?

☐ Annex 1 country ☐ Non-Annex 1 country

Are the project activities mandated by any law, statute, or other regulatory framework?

☐ Yes ☐ No

If the project is located inside a Non-Annex 1 country and the project activities are mandated by a law, statute, or other regulatory framework, are such laws, statutes, or regulatory frameworks systematically enforced?

☐ Yes ☐ No

If no, describe which mandated laws, statutes, or other regulatory frameworks require project activities and provide evidence of systematic non-enforcement to demonstrate regulatory surplus.

5 BIODIVERSITY

5.1 Without-Project Biodiversity Scenario

5.1.1 Existing Conditions (VCS, 3.19; CCB, B1.1)

Not included in the project description draft.

5.1.2 High Conservation Values (CCB, B1.2)

Not included in the project description draft.

5.1.3 Without-project Scenario: Biodiversity (CCB, B1.3)

Not included in the project description draft.

5.2 Net Positive Biodiversity Impacts

5.2.1 Expected Biodiversity Changes (VCS, 3.19; CCB, B2.1)

Not included in the project description draft.

5.2.2 Mitigation Measures (VCS, 3.19; CCB, B2.3)

Not included in the project description draft.

5.2.3 Net Positive Biodiversity Impacts (CCB, B2.2, GL1.4)

Not included in the project description draft.

5.2.4 High Conservation Values Protected (CCB, B2.4)

Not included in the project description draft.

5.2.5 Species Used (VCS, 3.19; CCB, B2.5, B2.6)

Not included in the project description draft.

5.2.6 Invasive Species (VCS, 3.19; CCB, B2.5)

Not included in the project description draft.

5.2.7 GMO Exclusion (CCB, B2.7)

Not included in the project description draft.

5.2.8 Input Justification (VCS, 3.19; CCB, B2.8)

Not included in the project description draft.

5.2.9 Waste Products (VCS, 3.19; CCB, B2.9)

Not included in the project description draft.

5.3 Offsite Biodiversity Impacts

5.3.1 Negative Offsite Biodiversity Impacts (CCB, B3.1) and Mitigation Measures (CCB, B3.2)

Not included in the project description draft.

5.3.2 Net Offsite Biodiversity Benefits (VCS, 3.19; CCB, B3.3)

Not included in the project description draft.

5.4 Biodiversity Impact Monitoring

5.4.1 Biodiversity Monitoring Plan (CCB, B4.1, B4.2, GL1.4, GL3.4)

Not included in the project description draft.

5.4.2 Biodiversity Monitoring Plan Dissemination (CCB, B4.3)

Not included in the project description draft.

5.5 Optional Criterion: Exceptional Biodiversity Benefits

Not included in the project description draft.

5.5.1 High Biodiversity Conservation Priority Status (CCB, GL3.1)

Not included in the project description draft.

5.5.2 Trigger Species Population Trends (CCB, GL3.2, GL3.3)

Not included in the project description draft.

APPENDIX 1: STAKEHOLDERS DESCRIPTION TABLE

Use this appendix, if necessary, to identify stakeholders and comply with Section 2.3.2 above. Modify the table, if necessary, to suit project activities, or delete if not used.

Stakeholders	Rights, interests and overall relevance to the project
Identify communities and any community groups within them, any cross-cutting community groups, and list other stakeholders.	

APPENDIX 2: PROJECT ACTIVITIES AND THEORY OF CHANGE TABLE

Use this appendix, if applicable, to identify project activities and fulfill the requirements of Section 2.1.17 above. This is an example of just one method of representing the theory of change. Results chains/flow diagrams are another effective way to represent the theory of change.

Modify the table, if necessary, to suit the project activities, or delete if not used.

Activity description	Expected climate, community and/or biodiversity			Relevance to project's objectives
	Outputs (short term)	Outcomes (medium term)	Impacts (long term)	

APPENDIX 3: PROJECT RISKS TABLE

Use this appendix to identify and summarize the project risks and fulfill the requirements of Sections 2.3.6, 2.3.17, 2.5, and 5.2.1 – 5.2.9, above. Where no risk is identified, write ‘No risk identified’ and provide justification in the third column. Add rows as needed.

	Identified risk(s)	Potential impact of risk on stakeholders, ecosystem health, and biodiversity	Mitigation or preventive measure(s) taken
Natural and human-induced risks to the well-being of stakeholders			
Risks for stakeholder participation			
Working conditions			
Safety of women and girls			
Safety of minority and marginalized groups, including children			
Pollutants (air, noise, water discharges, waste generation and release of hazardous materials and pesticides and chemical fertilizers)			
Discrimination			

Sexual harassment			
Equal pay for equal work			
Gender equality at work and in the workplace			
Forced labor ¹⁷			
Child labor			
Human trafficking			
Recognition, respect and promotion of the rights of IPs, LCs and customary rights holders			
Preserving and protecting cultural heritage			
Protect and preserve property rights, customary rights or protect legal or customary rights of possession/access to territories, properties and resources, including collective and/or conflicting rights			

¹⁷ Identified risks and proportionate mitigation or prevention measures for forced labor, child labor and human trafficking should include employees and workers hired by third parties.

Impacts on biodiversity and ecosystems			
Soil degradation and soil erosion			
Water consumption and stress			
Habitats (and areas necessary for habitat connectivity) for rare, threatened and endangered species			
Areas needed for habitat connectivity			
Invasive species			
Ecosystem conversion			
[Additional risk identified]			

APPENDIX 4: COMMERCIALY SENSITIVE INFORMATION

Use the table below to describe the commercially sensitive information included in the project description to be excluded in the public version.

Section	Information	Justification

APPENDIX X: <TITLE OF APPENDIX>

Use appendices for supporting information. Delete this appendix (title and instructions) where no appendix is required.
